

Homework questions

lukas_borges

Chapter 2 Review questions: R1, R4, R11, R14, R25

Chapter 2 Problems: P1, P4, P5, P10, P11, P14, P15

Chapter 3 Review questions: R1, R2, R14, R15, R17

Chapter 3 Problems: P1, P3, P26, P27, P31, P40

Chapter 2:

Review questions:

R1.

#	application	protocol
1	email	SMTP (simple mail transfer protocol)
2	file transfer	FTP (file transfer protocol)
3	web	HTTP (hyper text transfer protocol)
4	remote login	telnet
5	streaming services	RTP (real-time transport protocol)

R4.

What happens in P2P is that every user is a client and a server at the same time. There is still a client-server relationship, but it is interchangeable.

R11.

HTTP, FTP, SMTP and POP3 all require reliable data transfer. TCP provides schemes for data loss and corruption, while UDP works with a best-effort policy. Basic implementations of UDP do not guarantee information integrity, so important for the listed protocols.

R14.

telnet was not working as I expected, so I used Firefox developer tools instead:

first request

Request URL: http://gaia.cs.umass.edu/wireshark-labs/INTR0-wireshark-file1.html
Request method: GET
Remote address: 128.119.245.12:80
Status code: 200 OK
Version: HTTP/1.1

Edit and ResendRaw headers

Filter headers

Response headers (0.351 KB)

Accept-Ranges: "bytes"

Connection: "Keep-Alive"

Content-Length: "81"

Content-Type: "text/html; charset=UTF-8"

Date: "Mon, 29 Feb 2016 03:43:03 GMT"

Etag: ""51-52ccf11321b2c""

Keep-Alive: "timeout=5, max=100"

Last-Modified: "Sun, 28 Feb 2016 06:59:01 GMT"

Server: "Apache/2.4.6 (CentOS) OpenSSL/1.0.1e-fips PHP/5.4.16 mod_perl/2.0.9dev Perl/v5.16.3"

Request headers (0.334 KB)

Host: "gaia.cs.umass.edu"

User-Agent: "Mozilla/5.0 (Macintosh; Intel Mac OS X 10.10; rv:44.0) Gecko/20100101 Firefox/44.0"

Accept: "text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8"

Accept-Language: "en-US,en;q=0.5"

Accept-Encoding: "gzip, deflate"

Connection: "keep-alive"

after selecting `Edit and Resend` , I manually edited the header:

```
Request headers:
Host: gaia.cs.umass.edu
User-Agent: Mozilla/5.0 (Macintosh; Intel Mac OS X 10.10;
rv:44.0) Gecko/20100101 Firefox/44.0
Accept: text/html,application/xhtml+xml,application
/xml;q=0.9,*/*;q=0.8
Accept-Language: en-US,en;q=0.5
Accept-Encoding: gzip, deflate
Connection: keep-alive
If-Modified-Since: Sun, 28 Feb 2016 06:59:01 GMT
If-None-Match: "51-52ccf11321b2c"
Cache-Control: max-age=0
```

this is the response:

```
Request URL: http://gaia.cs.umass.edu/wireshark-labs/INTRO-wireshark-file1.html
Request method: GET
Remote address: 128.119.245.12:80
Status code: ▲ 304 Not Modified
Version: HTTP/1.1
Edit and Resend
Raw headers

Filter headers

Response headers (0.235 KB)
Connection: "Keep-Alive"

If-None-Match: ""51-52ccf11321b2c""
Cache-Control: "max-age=0"
```

Works as proposed.

R25.

- 1. Messaging
- 2. Real time communication (Skype)
- 3. File Sharing (torrent)
- 4. Distributed Computing

Problems

P1.

statement	answer
a	False
b	True
c	False
d	False
e	False

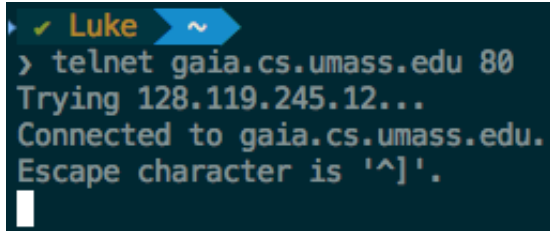

P4.

a. <http://gaia.cs.umass.edu/cs453/index.html>

b. HTTP/1.1

c. Connection:keep-alive , persistent

d.

```
> telnet gaia.cs.umass.edu 80
Trying 128.119.245.12...
Connected to gaia.cs.umass.edu.
Escape character is '^['.
```

128.119.245.12

e. Mozilla Firefox. Browser information is needed by the server in order to send different versions of the same object to different types of browsers.

P5.

a. Status code: 200 OK .

Date Tue 07 Mar 2008 12:39:45 GMT

b. Last-Modified: Sat, 10 Dec 2005 18:27:46 GMT

c. Content-Length: 3874 (bytes)

d. <!doc . Yes, according to Connection: Keep-Alive

P10.

persistent HTTP:

total time to receive all objects:

$$\begin{aligned} & \left(\frac{200}{150} + T_p + \frac{200}{150} + T_p + \frac{200}{150} + T_p + \frac{100,000}{150} + T_p \right) + \\ & \left(\frac{200}{150} + T_p + \frac{200}{150} + T_p + \frac{200}{150} + T_p + \frac{100,000}{150} + T_p \right) \\ &= \left(\frac{200 + 200 + 200 + 100,000}{150} + 4T_p \right) \\ &+ \left(\frac{200 + 200 + 200 + 100,000}{15} + 4T_p \right) \\ &= \left(\frac{100,600}{150} + 4T_p \right) + \left(\frac{100,600}{15} + 4T_p \right) \end{aligned}$$

$$\begin{aligned}
&= (670 + 4T_p) + (6706 + 4T_p) \\
&= 7377 + 8 * T_p \text{ seconds}
\end{aligned}$$

time needed:

$$\begin{aligned}
&\left(\frac{200}{150} + T_p + \frac{200}{150} + T_p + \frac{200}{150} + T_p + \frac{100,000}{150} + T_p \right) + \\
&\quad 10 * \left(\frac{200}{150} + T_p + \frac{100,000}{150} + T_p \right) \\
&= \left(\frac{200 + 200 + 200 + 100,000}{150} + 4T_p \right) + 10 * \left(\frac{200 + 100,000}{150} + 2T_p \right) \\
&= \left(\frac{100,600}{150} + 4T_p \right) + 10 * \left(\frac{100,200}{150} + 2T_p \right) \\
&= (670 + 4T_p) + (6680 + 20T_p) \\
&= 7350 + 24 * T_p
\end{aligned}$$

propagation speed of the medium: $300 * 10^6 m/sec$

$$T_p = \frac{10}{(300 * 10^6)} = 0.03 \text{ microseconds}$$

For this case, persistent HTTP has no significant gain over non-persistent.

P11.

a. Yes. Bob's parallel connections will help him get pages quicker since he is using parallel instance of non-persistent HTTP while the others use non-persistent HTTP with parallel download.

b. Yes, even if all five users open five parallel instances of non-persistent HTTP. If Bob does not use parallel connections, he will get less bandwidth share. At this point, everyone (including Bob) should get equal bandwidth.

P14.

- SMTP uses period [.] to indicate end of message body.
- HTTP uses Content-Length header field to indicate end of message body.
HTTP cannot use the same method because there is no format for message body

in HTTP.

P15.

MTA: Mail Transfer Agent.

Mail received from	Mail received by
barmail.cs.umass.edu [128.119.240.3]	cs.umass.edu [8.13.1/8.12.6]
asusus-4b96 [localhost (127.0.0.1)]	barmail.cs.umass.edu
asusus-4b96 [58.88.21.177]	barmail.cs.umass.edu
[58.88.21.177]	lnbnd55.exchangedddd.com

At `asusus-4b96[58.88.21.177]` the MTA does not report from where it receives the email (dishonest). If the mail is spam, only originator can be dishonest.

`asusus-4b96[58.88.21.177]` is the malicious host that generated spam.

Chapter 3:

Review questions:

R1.

a.

Transport protocol (TP):

- Accept chunk of data, Destination's host address and port number (given by the sender)
- Maximum size of data: 1196 bytes
- Add a 4-byte header to each chunk
- Number of destinations included in header
- Destination host address and resulting segment are passed to the network layer by our TP.
- Network layer delivers segment to TP at destination.
- At destination, port number from segment is analyzed by the TP, which catches

the data and sends it to the process with port number accordingly.

b.

Modified TP (mTP):

- Accept chunk of data, Destination's host address and port number (given by the sender)
- Maximum size of data: 1196 bytes
- Segment now has two header fields. One is used to specify source port and another to specify destination port.
- Add two 4-byte headers to each chunk. Include source port number and destination port number in two header fields.
- Destination host address, and resulting segment are passed to the network layer by mTCP
- Network layer delivers segment to mTCP at destination
- At destination, port number in the segment is examined by mTCP, which catches the data and sends it to the process with port number accordingly.
- It also gives the source port number to the application

c. No, transport layer only acts in the end systems.

R2.

a.

- Sender give delegate the letter along with the address of the destination's house and the name of the recipient.
- Delegate writes recipient's name is written on top of the letter.
- Letter is put into an envelope. Destination's house address is written by the delegate.
- Delegate passes letter to the planet's mail service.
- Receiver accepts letter from delegate. Envelope is opened and recipient's name written on top is stored.
- Delegate hand overs the letter according to the family name written on top.

b.

No, there is no need for the mail service to open the envelope and examine address. Envelope is opened by the delegate. Recipient's name written on top is noticed in order to deliver accordingly.

R14.

statement	answer
a	False
b	False
c	True
d	False
e	True
f	False
g	False

R15.

a.

first segment $\text{SEQNUM} = 90$

second segment $\text{SEQNUM} = 110$

data in first segment: $110 - 90 = 20 \text{ bytes}$

b.

90 is the segment number of the first segment.

R17.

TCP shares Rate $\frac{R}{2} \text{ bps}$ to each TCP connection

Problems:

P1.

prompt	connection	source port	destination port
a	$A \rightarrow S$	467	23
b	$B \rightarrow S$	513	23
c	$S \rightarrow S$	23	467
d	$S \rightarrow B$	23	513

e.

Yes, because IP addresses are also included.

f.

No, the server uses IP addresses to distinguish between hosts.

P3.

part 1:

first byte: 0101 0011

second byte: 0110 0110

third byte: 0111 0100

first + second:

```
0101 0011 +
0110 0110
```

1011 1001 (first sum)

first sum + third byte

```
1011 1001 +
0111 0100
```

wrap around: (1) 0010 1101 (second sum)

1

Total Sum: 0010 1110

Checksum: 1101 0001

1s complement of: 0010 1110 = 1101 0001

Same as Checksum.

part 2: When the 1's complement of sum is performed, resultant will be the checksum. Receiving host uses the checksum so check for errors.

part 3: At receiving end, all bytes (including checksum) are added. Receiver looks at the checksum to for errors. If the sum contains all 1s, no errors. If there is at least one 0 bit, there is an error.

part 4: All one-bit errors will be detected. Two bit errors can be undetected since they could end up complementing each others' value.

P26.

a.

MSS = 536 bytes

TCP sequence number field = 4 bytes

$$= 4 * 8 = 32 \text{ bits} = 2^{32}$$

Maximum file size that can be sent is given by how many bytes can be represented by 2^{32}

$$= 2^2 * 2^{30} \text{ bytes}$$

$$= 2^2 \text{ Gbytes or } 4 \text{ Gbytes}$$

b.

$$\text{Number of Segments} = \frac{2^{32}}{536} = 801299$$

$$\text{Number of bytes in each segment} = 66$$

$$\text{Total number of bytes sent over the 155Mbps link} = 801299 * 66 \text{ bytes}$$

$$= 528857934 \text{ bytes} = 4.824 * 10^9 \text{ bytes}$$

time it takes:

$$\frac{4.824 * 10^9 * 8 \text{ bits}}{155 * 10^6 \text{ bps}}$$
$$\approx 249 \text{ seconds}$$

P27.

a.

SEQNUM = SEQNUM of first segment + number of bytes of data in first segment

$$127 + 80 = 207$$

Source port: 302

Destination port: 80

b.

Acknowledgement number: 207

Source port: 80

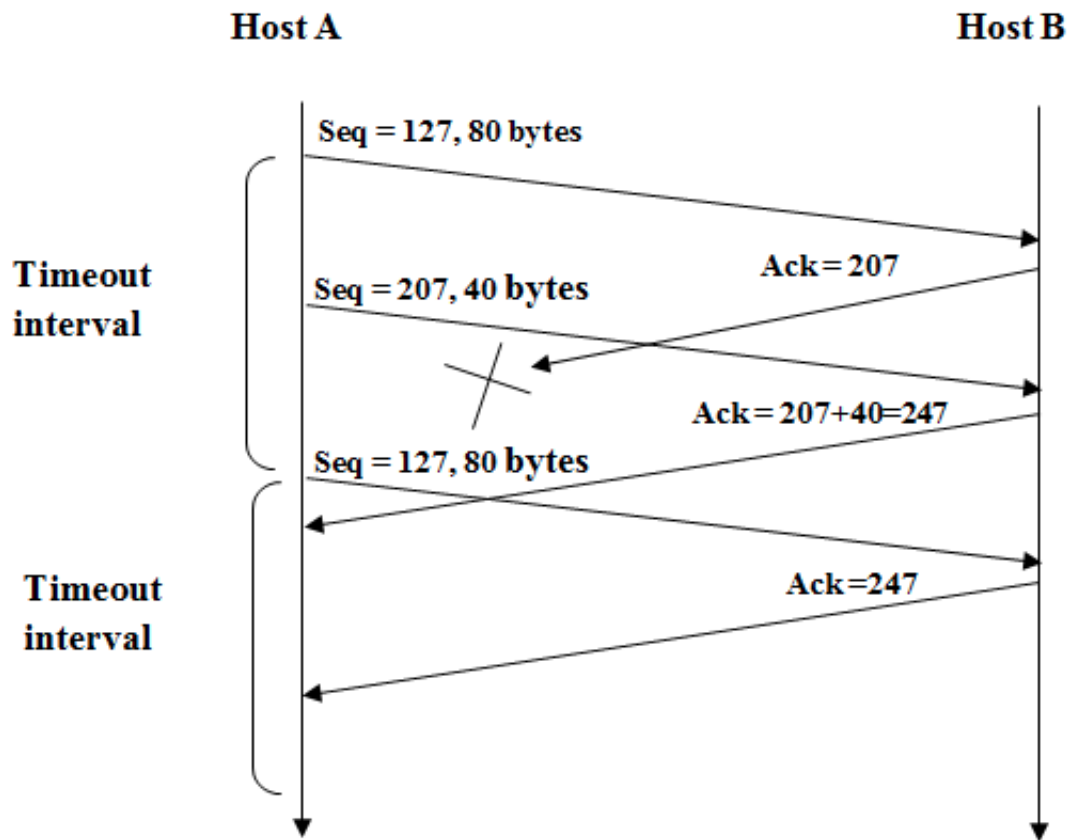

Destination port: 302

c.

Acknowledgement number: 127

Because the receiver is waiting for 127 bytes of upcoming data.

d.

Even though ACK 207 is loss, when Host A receives ACK 247, it knows that packet 207 was received.

P31.

- $EstimatedRTT = (1 - \alpha) * EstimatedRTT + \alpha * SampleRTT$
- $DevRTT = (1 - \beta) * DevRTT + \beta * |SampleRTT - EstimatedRTT|$
- $Timeout\ Interval = EstimatedRTT + 4 * DevRTT$

First sample (106 ms):

EstimatedRTT: $0.875 * 100 + 0.125 * 106 = 100.75$

DevRTT: $0.75 * 5 + 0.25 * 5.25 = 5.06$

TimeOut Interval: $100.75 + 4 * 5.06 = 120.99$

Second sample (120 ms):

EstimatedRTT: $0.875 * 100 + 0.125 * 120 = 103.156$

DevRTT: $0.75 * 5.06 + 0.25 * 16.84 = 8$

TimeOut Interval: $103.156 + 4 * 8 = 135.156$

Third sample (140 ms):

EstimatedRTT: $0.875 * 103.156 + 0.125 * 140 = 107.761$

DevRTT: $0.75 * 8 + 0.25 * 32.239 = 14.05$

TimeOut Interval: $107.761 + 4 * 14.05 = 163.961$

Fourth sample (90 ms):

EstimatedRTT: $0.875 * 107.761 + 0.125 * 90 = 105.54$

DevRTT: $0.75 * 14.05 + 0.25 * (-15.54) = 6.73$

TimeOut Interval: $105.54 + 4 * 6.73 = 132.46$

$TimeoutInterval_{90} = 132.46$

SampleRTT (115 ms):

EstimatedRTT: $0.875 * 105.54 + 0.125 * 115 = 106.772$

DevRTT: $0.75 * 6.73 + 0.25 * |115 - 106.772| = 7.10$

TimeOut Interval: $106.772 + 4 * 7.10 = 135.122$

$TimeoutInterval_{115} = 135.122$

P40.

a.

[1,6] and [23, 26]

b.

[6,16] and [17,22]

c.

Yes, the segment loss after 16th transmission is indicated by triple-duplicate ACK.

d.

Yes, segment loss after 22nd transmission is indicated by a timeout.

e.

Initial threshold (segment size threshold) value at the first transmission is 32.

f.

Threshold value during 18th transmission is 21.

g.

Threshold value during 24th transmission round is 14 (approx).

h.

transmission	packet number
1	1
2	2 - 3
3	4 - 7
4	8 - 15
5	16 - 31
6	32 - 63
7	64 - 96

70th segment is transmitted in the 7th round.

i.

Threshold value after 26th transmission is 4.

j.

Threshold value at 19th transmission is 21 and congestion window size is 1.

k.

Total of 52 packets.

Transmission Round	Number of Packets
17	1
18	2
19	4
20	8
21	16
22	21
total	52
